

BASH SCRIPTING

Loops

CONTENTS

1. Introduction to loops
2. Different Types of for loop syntaxes
3. Installing multiple packages with for loop and command line arguments
4. Loop control statements or commands
5. Difference between `$@` and `$*`

While Loop

```
1.  #!/bin/bash
2.  # Basic while loop
3.  counter=1
4.  while [ $counter -le 10 ]
5.  do
6.  echo $counter
7.  ((counter++))
8.  done
9.  echo All done
```

Until Loop

```
1.  #!/bin/bash
2.  # Basic until loop
3.  counter=1
4.  until [ $counter -gt 10 ]
5.  do
6.  echo $counter
7.  ((counter++))
8.  done
9.  echo All done
```

For Loop

```
1.  #!/bin/bash
2.  # Basic for loop
3.  names='Stan Kyle Cartman'
4.  for name in $names
5.  do
6.  echo $name
7.  done
8.  echo All done
```

For with Range

```
1.  #!/bin/bash
2.  # Basic range in for loop
3.  for value in {1..5}
4.  do
5.  echo $value
6.  done
7.  echo All done
```

For Loop Stepping

It is also possible to specify a value to increase or decrease by each time. You do this by adding another two dots (..) and the value to step by.

```
1.  #!/bin/bash
2.  # Basic range with steps for loop
3.
4.  for value in {10..0..2}
5.  do
6.  echo $value
7.  done
8.
9.  echo All done
```

For loop to process set of Files

One of the more useful applications of **for** loops is in the processing of a set of files. To do this we may use [wildcards](#). Let's say we want to convert a series of .html files over to .php files.

```
1.  #!/bin/bash
2.  # Make a php copy of any html files
3.  for value in $1/*.html
4.  do
5.      cp $value $1/${ basename -s .html $value }.php
6.  done
```

Break

The **break** statement tells Bash to leave the loop straight away. It may be that there is a normal situation that should cause the loop to end but there are also exceptional situations in which it should end as well. For instance, maybe we are copying files but if the free disk space get's below a certain level we should stop copying.

```
1.  #!/bin/bash
2.  # Make a backup set of files
3.  for value in $1/*
4.  do
5.    used=$( df $1 | tail -1 | awk '{ print $5 }' | sed 's/%//' )
6.    if [ $used -gt 90 ]
7.    then
8.      echo Low disk space 1>&2
9.      break
10.   fi
11.   cp $value $1/backup/
12. done
```

Continue

The **continue** statement tells Bash to stop running through this iteration of the loop and begin the next iteration. Sometimes there are circumstances that stop us from going any further. For instance, maybe we are using the loop to process a series of files but if we happen upon a file which we don't have the read permission for we should not try to process it.

```
1.  #!/bin/bash
2.  # Make a backup set of files
3.  for value in $1/*
4.  do
5.    if [ ! -r $value ]
6.    then
7.      echo $value not readable 1>&2
8.      continue
9.    fi
10.   cp $value $1/backup/
11. done
```

Menu using Select

```
1.  #!/bin/bash
2.  # A simple menu system
3.  names='Kyle Cartman Stan Quit'
4.  PS3='Select character: '
5.  select name in $names
6.  do
7.      if [ $name == 'Quit' ]
8.      then
9.          break
10.     fi
11.     echo Hello $name
12. done
13. echo Bye
```

Difference between \$a and \$* and install multiple packages using command line arguments.

```
#!/bin/bash
sudo apt update -y
for app in "$@"; do
    echo "Installing $app..."
    sudo apt install -y "$app"
done
```

- `$@` takes all the command line arguments as an array while `$*` differentiates the command line using words.
- The file names `cli_arg.sh` can be executed with command line arguments as:

`./cli_arg.sh wget nginx`
- This will install `wget` `nginx` using for loop.
